

Functionality to Calculate the Area for Different Geometric Dimensions for Mathematics Project.

Description:

Creating a Java project that shows how to develop functionality to calculate the area for different geometric dimensions based on the number of parameters passed.

Algorithm:-

Step 1:- Create a project in the eclipse IDE.

Step 2:- Create a package with name "Geometricaldimension" in that project.

Step 3:- Create a parent class named "Shapes" inside the "Geometricaldimension" package

Step 4:- Create child classes inside the same package for different geometric shapes.

Step 5:- Create a finalresult class in the same package to demonstrate the area calculations.

Step 6:- Run the program to see output.
